

Process Work

My thoughts

My first thoughts were to make a siri type program with a bunch of questions they could answer. It would basically answer fun facts like who was the first person on the moon and stuff.

I think I also could have done a little game where you had to answer questions. It would tell you the questions and you could pick one and answer it.

But I got caught up with thinking about how to make a mini calculator. I was thinking about how to make something that could add any number from 1 to 9. I looked at the Arithmetic Operators addition and used that over and over (later I would realise I could make it easier). The way I started it was by using wrightline to tell the person the name of him. I named him Anton. I also added a joke because I was still thinking of the siri part but I ended up thinking of the calculator and thought it would take longer than expected.

In the end it taught me valuable lessons about coding and that I could have shortened the time it would have taken to make it and would have allowed me to do more.
